Finite Automata

- *Automaton* is a triple $A = (Q, X, \delta)$
 - Q ... finite set of *states*
 - X ... finite set of *letters* (the *alphabet*)
 - δ ... total function $Q \times X \rightarrow Q$ (*transition function*)
- Extended transition function:

$$\delta : 2^Q \times X^* \rightarrow 2^Q$$

Finite Automata

- *Automaton* is a triple $A = (Q, X, \delta)$
 - Q ... finite set of *states*
 - X ... finite set of *letters* (the *alphabet*)
 - δ ... total function $Q \times X \rightarrow Q$ (*transition function*)
- Extended transition function:

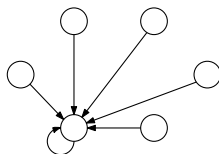

$$\delta : 2^Q \times X^* \rightarrow 2^Q$$

Reset Words

- $w \in X^*$ is a *reset word* of A if

$$|\delta(Q, w)| = 1,$$

i.e. if w acts like

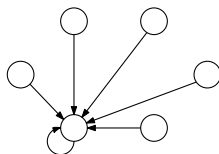

- If A has some reset word, we call it *synchronizing*.

Reset Words

- $w \in X^*$ is a *reset word* of A if

$$|\delta(Q, w)| = 1,$$

i.e. if w acts like

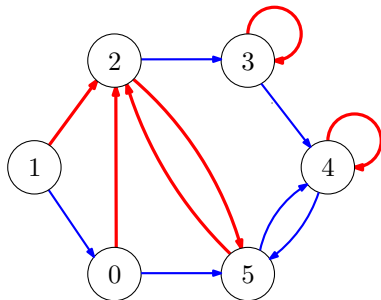

- If A has some reset word, we call it *synchronizing*.

Reset Words: an Example

$$Q = \{0, 1, 2, 3, 4, 5\}$$

$$X = \{a, b\}$$

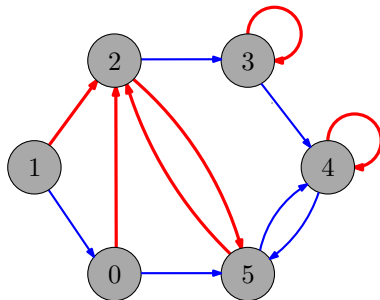

Reset Words: an Example

$$Q = \{0, 1, 2, 3, 4, 5\}$$

$$X = \{a, b\}$$

$w =$

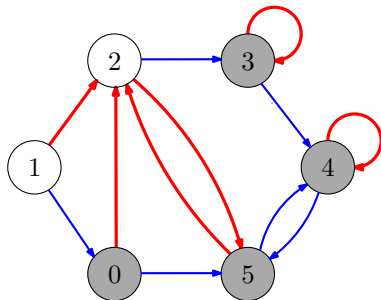

Reset Words: an Example

$$Q = \{0, 1, 2, 3, 4, 5\}$$

$$X = \{a, b\}$$

$$w = b$$

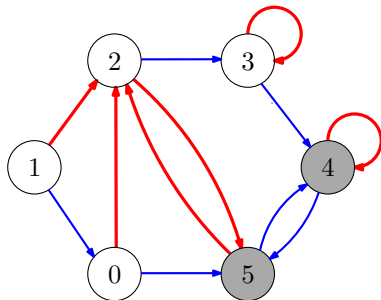

$$\left| \delta(Q, w) \right| = 4$$

Reset Words: an Example

$$Q = \{0, 1, 2, 3, 4, 5\}$$

$$X = \{a, b\}$$

$$w = bb$$

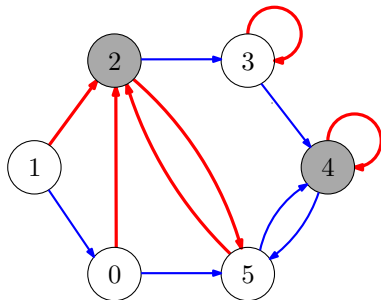

$$|\delta(Q, w)| = 2$$

Reset Words: an Example

$$Q = \{0, 1, 2, 3, 4, 5\}$$

$$X = \{a, b\}$$

$$w = bba$$

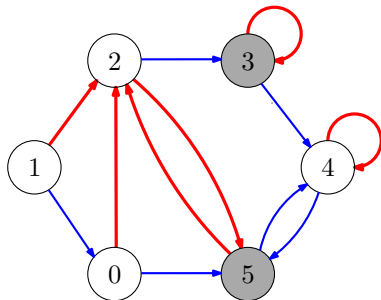

$$|\delta(Q, w)| = 2$$

Reset Words: an Example

$$Q = \{0, 1, 2, 3, 4, 5\}$$

$$X = \{a, b\}$$

$$w = \mathit{bbab}$$

$$|\delta(Q, w)| = 2$$

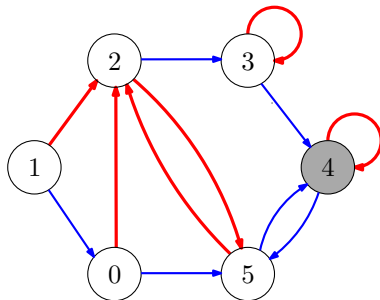

Reset Words: an Example

$$Q = \{0, 1, 2, 3, 4, 5\}$$

$$X = \{a, b\}$$

$$w = bbabb$$

is a reset word

$$|\delta(Q, w)| = 1$$

Short Reset Words

■ Černý conjecture:

- If A is synchronizing, it has a reset word of length at most $(|Q| - 1)^2$

■ Known bounds:

- $\frac{1}{3} |Q|^3 - n^2 + \frac{5}{3}n - 1$ (Kohavi, 1970)
- $\frac{1}{6} |Q|^3 - \frac{1}{6}n$ (Pin, 1983)
- $\frac{7}{48} |Q|^3 + \frac{1}{8}n^2 - \frac{1}{3}n$ (Trakhtman, 2011)

Short Reset Words

■ Černý conjecture:

- If A is synchronizing, it has a reset word of length at most $(|Q| - 1)^2$

■ Known bounds:

- 3 Present Result

Computational tasks

EX-SYN: Given an automaton A , decide if it has **any** reset word.

- *Solvable in polynomial time*

MIN-SYN: Given an automaton A and a number d , decide if d is the length of **shortest** reset words of A .

- *Both NP-hard and coNP-hard*

SYN: Given an automaton A and a number d , decide if A has a reset word **of length at most** d .

- *NP-complete*

Reductions from SAT

Propositional formula φ in CNF

Automaton A and number d

such that

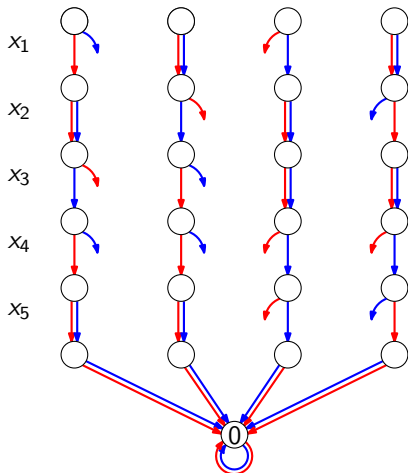

φ is satisfiable

A has a reset word of length at most d

$$\varphi = (x_1 \vee \overline{x_3} \vee x_4) \wedge (\overline{x_2} \vee x_3 \vee x_4) \wedge (\overline{x_1} \vee \overline{x_4} \vee \overline{x_5}) \wedge (x_2 \vee \overline{x_4} \vee x_5)$$

↓

$$X = \{1, 0\}$$

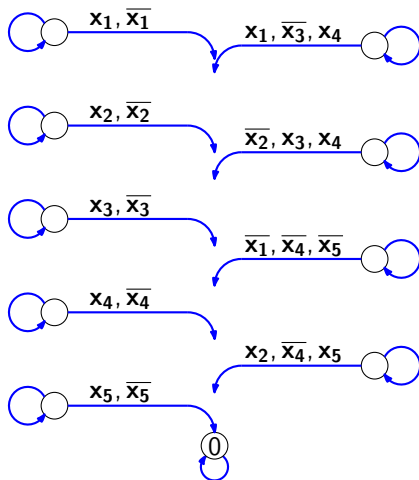

$$d = 5$$

Is there a reset word of length 5?

Second Method

$$\varphi = (x_1 \vee \bar{x}_3 \vee x_4) \wedge (\bar{x}_2 \vee x_3 \vee x_4) \wedge (\bar{x}_1 \vee \bar{x}_4 \vee \bar{x}_5) \wedge (x_2 \vee \bar{x}_4 \vee x_5)$$

↓

$$X = \{x_1, \dots, x_n, \bar{x}_1, \dots, \bar{x}_n\}$$

$$d = 5$$

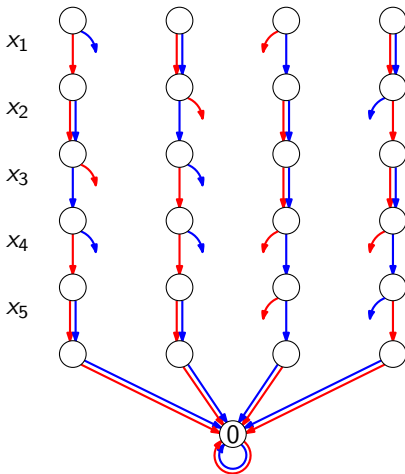

Is there a reset word of length 5?

An automaton $A = (Q, X, \delta)$ is ***Eulerian*** if each state has $|X|$ incoming transitions.

$$X = \{1, 0\}$$

$$d=5$$

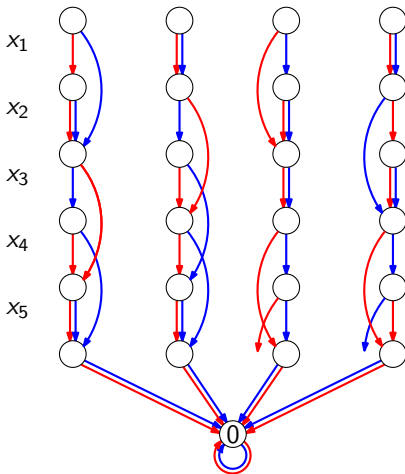

$$\begin{array}{cc} (x_1 \vee \bar{x}_3 \vee x_4) & (\bar{x}_1 \vee \bar{x}_4 \vee \bar{x}_5) \\ (\bar{x}_2 \vee x_3 \vee x_4) & (x_2 \vee \bar{x}_4 \vee x_5) \end{array}$$

$$X = \{1, 0\}$$

$$d=5$$

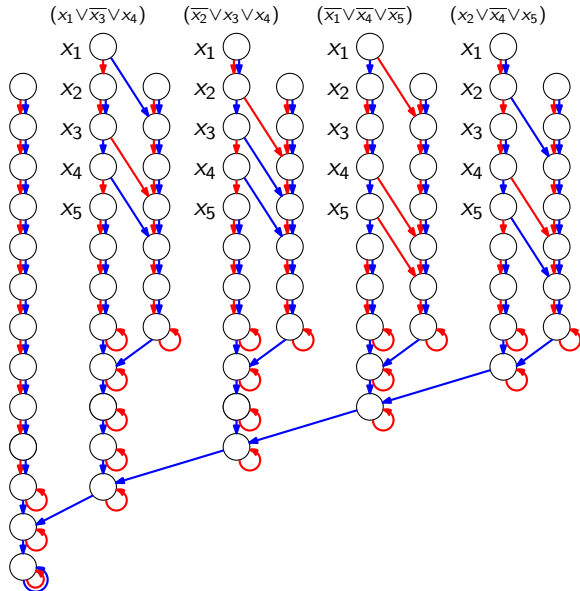

$$\begin{array}{cc} (x_1 \vee \bar{x}_3 \vee x_4) & (\bar{x}_1 \vee \bar{x}_4 \vee \bar{x}_5) \\ (\bar{x}_2 \vee x_3 \vee x_4) & (x_2 \vee \bar{x}_4 \vee x_5) \end{array}$$

Eulerian automata

$$X = \{1, 0\}$$

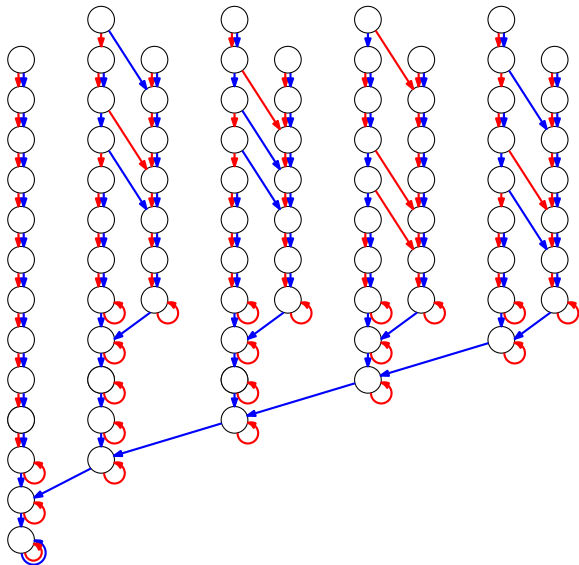

$$d=12$$

Eulerian automata

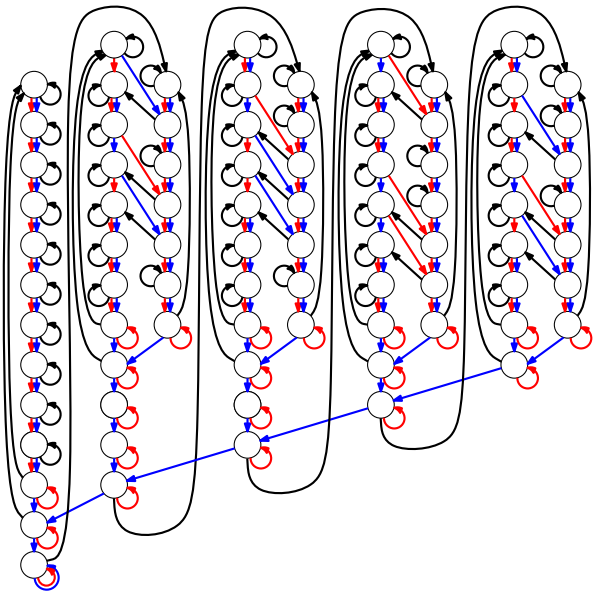

$$X = \{1, 0\}$$

$$d=12$$

$$X = \{1, 0, c\}$$

$$d=12$$

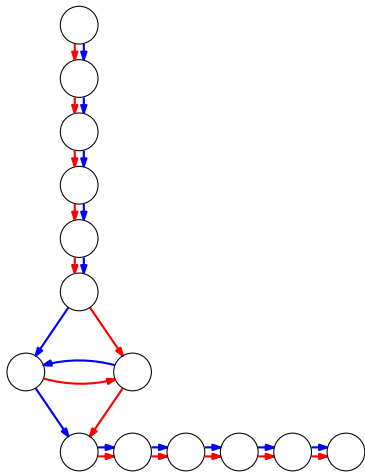

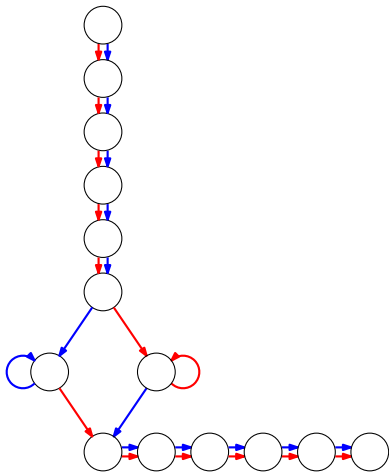

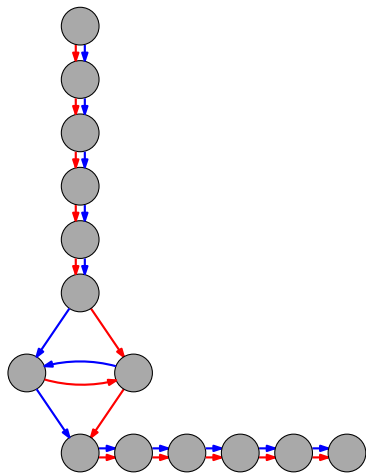

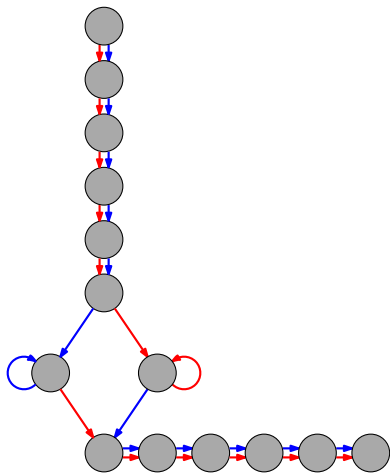

Present Result

SYN is NP-complete even if restricted to Eulerian automata with a two-letter alphabet.

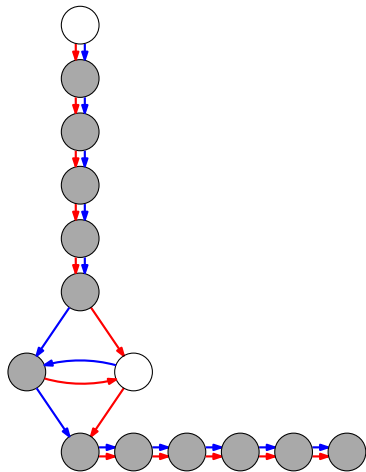

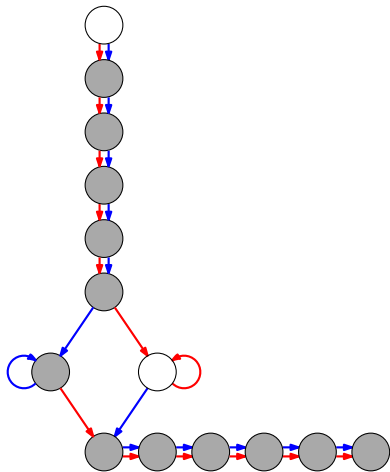

Proof Ideas

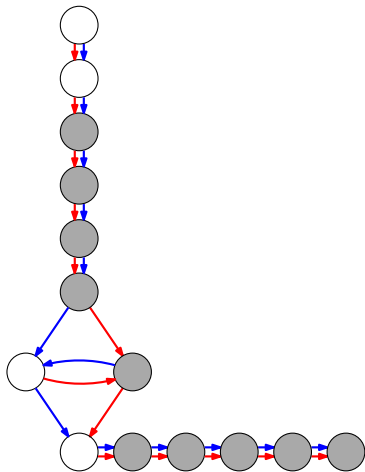

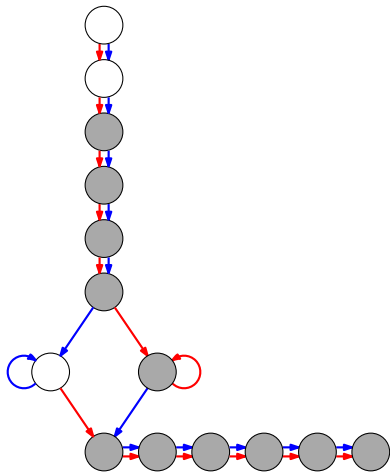

- φ in 3-CNF
- *Recording*
- *Testing*

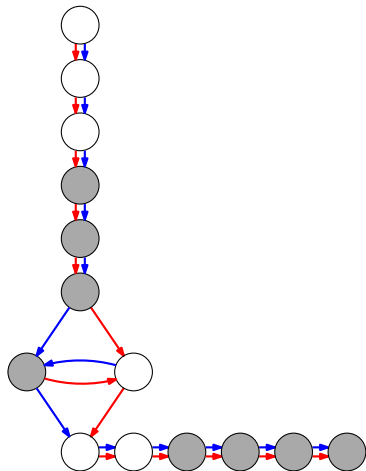

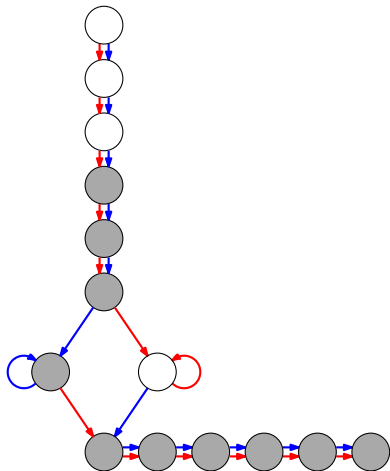

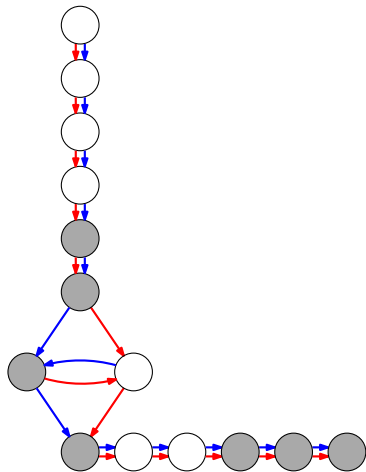

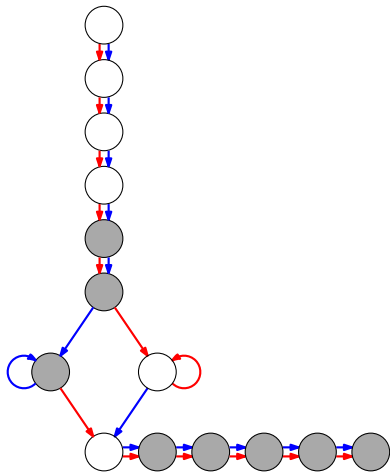

$$w = a$$

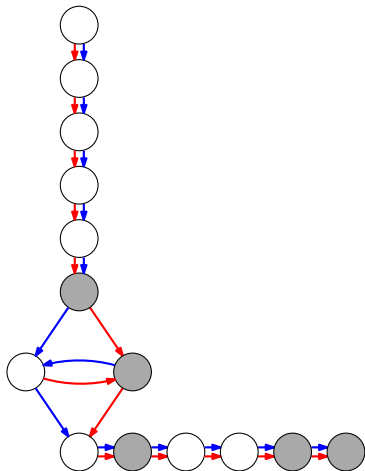

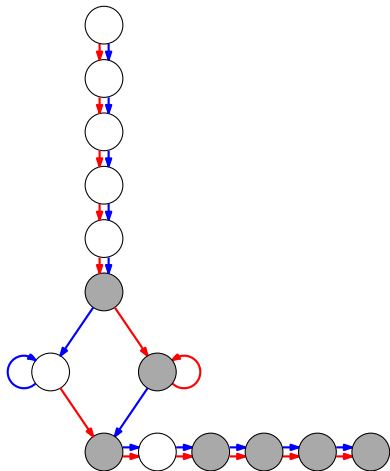

$w = ab$ 

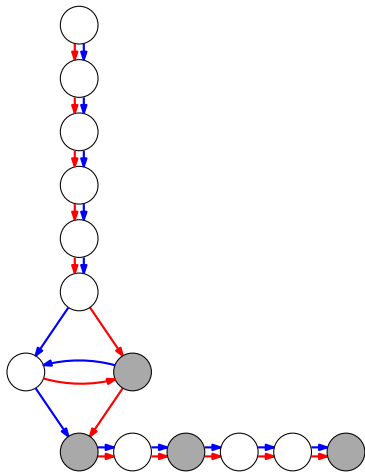

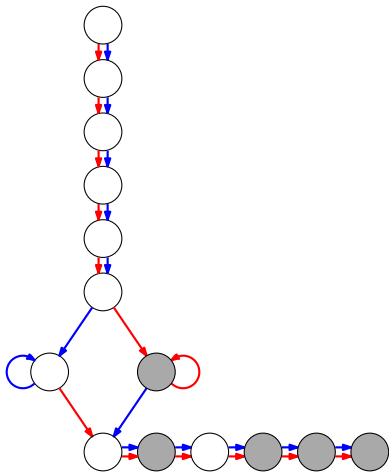

$w = aba$

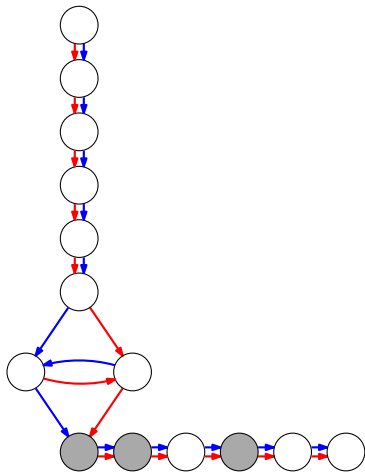

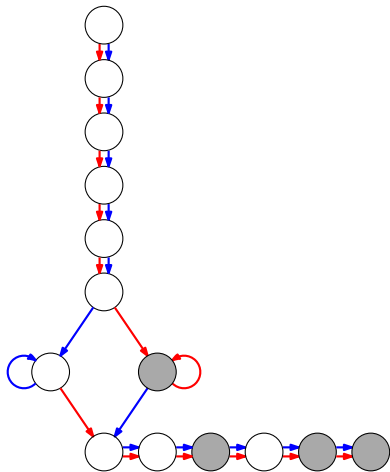

$w = abaa$ 

$w = \text{abaab}$

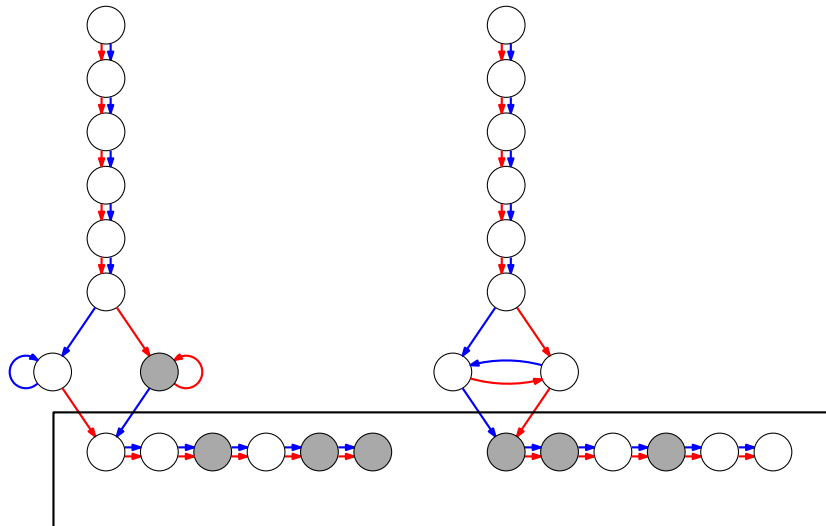

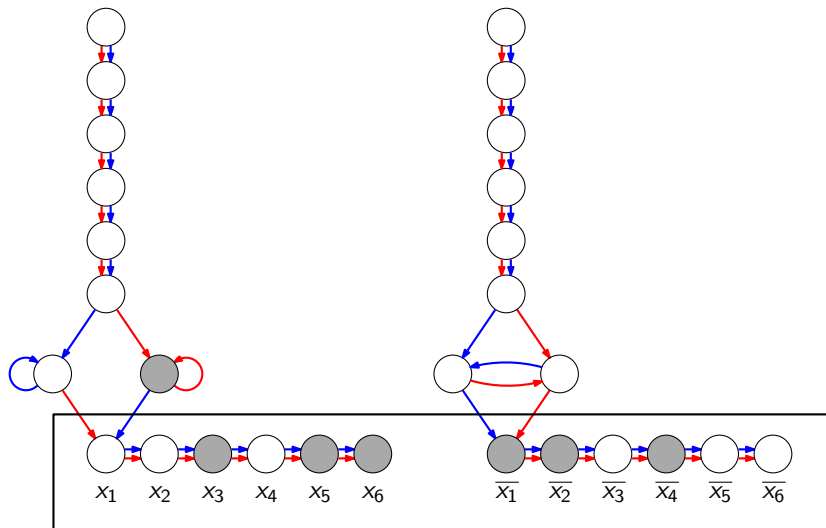

$w = \text{abaabb}$

$w = \text{abaabbb}$

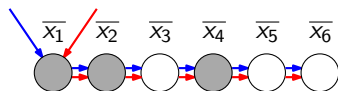

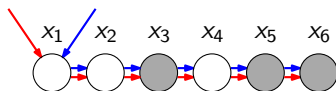

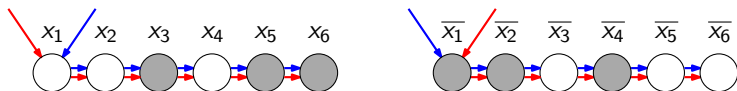

$w = \text{abaabbb}$

$w = \text{aba} \textit{abbb}$

Summary

- A **reset word** takes all the states to some unique state.
- **SYN**: Does A have a reset word of length at most d ?

- SYN is NP-complete (Eppstein, 1990).

- Does SYN remain NP-hard if restricted to **Eulerian automata** with a **constant-size alphabet**?
 - For 3-letter alphabets it does (Martyugin, 2011).
 - For 2-letter alphabets it does as well.
